LA FRAGILITÀ NEL PAZIENTE ONCOLOGICO: I BENEFICI DEGLI INTERVENTI BASATI SULLA VALUTAZIONE GERIATRICA

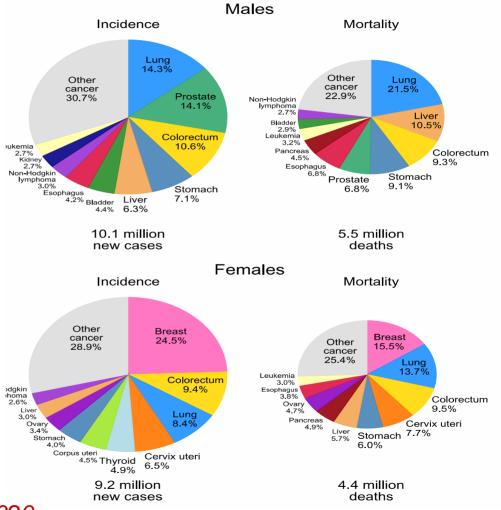

- Worldwide an estimated <u>19.3 million</u> new cancer cases and almost <u>10</u> <u>million cancer deaths</u> occurred in 2020.
- The most commonly diagnosed cancers: female breast cancer (11.7%), lung cancer (11.4%) and colorectal cancer (10%).
- Lung cancer is the leading cause of cancer death, 1.8 million deaths (18%), followed by colorectal cancer (9.4%).

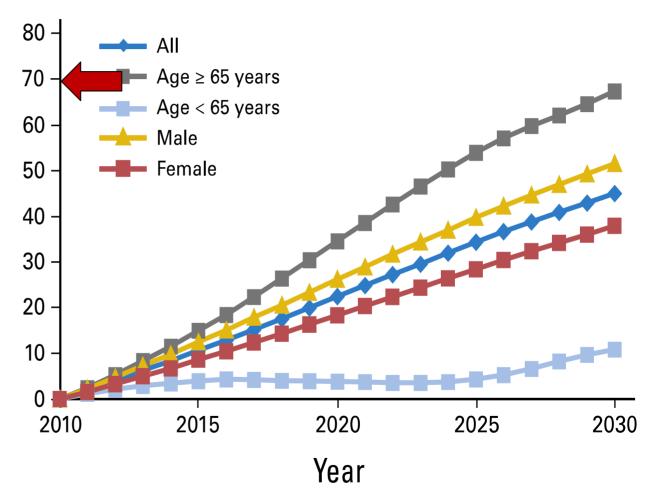

- The incidence rate for all cancers combined was 19% higher in men than in women
- The gender gap for overall cancer mortality worldwide is twice that for incidence, with death rates 43% higher in men than in women.

- •Female Breast Cancer: 62 years the median age of a breast cancer diagnosis and nearly 20 percent of women diagnosed are over the age of 75 (USA Surveillance Epidemiology and End Results registry).
- •Lung Cancer: 37% occur over 75 years old (Torre L.A et al Lung cancer statistics 2018)
- •Colerectal cancer: 60% of patients are > 70% years at the time of diagnosis (*National Cancer Registration and Analysis UK 2015*)
- By 2030 cancer diagnosis in elderly will increase up to 70%

An update on a systematic review of the use of geriatric assessment for older adults in oncology

M. T. E. Puts^{1*}, B. Santos¹, J. Hardt¹, J. Monette², V. Girre³, E. G. Atenafu⁴, E. Springall⁵ & S. M. H. Alibhai⁶

Background: Our previous systematic review of geriatric assessment (GA) in oncology included a literature search up to November 2010. However, the quickly evolving field warranted an update. Aims of this review: (i) provide an overview of all GA instruments developed and/or in use in the oncology setting; (ii) evaluate effectiveness of GA in predicting/modifying outcomes (e.g., treatment decision impact, treatment toxicity, mortality, use of care).

Materials and methods: Systematic review of literature published between November 2010 and 10 August 2012. English, Dutch, French and German-language articles reporting cross-sectional or longitudinal, intervention or observational studies of GA instruments were included. Data sources: MEDLINE, EMBASE, PsycINFO, CINAHL and Cochrane Library. Two researchers independently reviewed abstracts, abstracted data and assessed the quality using standardized forms. A meta-analysis method of combining proportions was used for the outcome impact of GA on treatment modification with studies included in this update combined with those included in our previous systematic review on the use of GA.

Results: Thirty-five manuscripts reporting 34 studies were identified. Quality of most studies was moderate to good. Eighteen studies were prospective, 11 cross-sectional and 5 retrospective. Three studies examined treatment decision-making impact and found decisions changed for fewer than half of assessed patients (weighted percent modification is 23.2% with 95% confidence interval (20.3% to 26.1%). Seven studies reported conflicting findings regarding predictive ability of GA for treatment toxicity/complications. Eleven studies examined GA predictions of mortality, and reported that instrumental activities of daily living, poor performance status and more numerous GA deficits were associated with increased mortality risk. Other outcomes could not be meta-analyzed.

Conclusion: Consistent with our previous review, several domains of GA are associated with adverse outcomes. However, further research examining effectiveness of GA on treatment decisions and oncologic outcomes is needed.

 ADL, IADL, performance status, increased number of deficits/frailty markers were associated with poor health outcomes such as toxicity of treatment and mortality.

CONCLUSIONS

✓ CGA-driven interventions are associated with a lower risk of treatmentrelated toxicity compared to standard care

LA LONGEVITÀ DECLINATA AL FEMMINILE

- ✓ CGA-driven interventions did not modificate the risk of early therapy discontinuation or unplanned hospitalizations
- ✓ Further RCT should investigate the role of CGA-driven interventions on outcomes and also from a gender-related perspective.
- ✓ The result of the geriatric assessment should be incorporated into oncologic decision-making.
